Abstract

Heterocyclic compounds are widely distributed in nature and also present in variety of drug molecules. Among the heterocyclic compounds, pyridine is one of the important heterocyclic scaffolds.[1]Pyridine ring present in many naturally occurring compounds which are essential for living systems such as niacin (Vit. B_3) and pyridoxine (Vit. B_6).Specifically, 3-cyanopyridines possess diverse biological activities like progesterone receptor agonist, Glue R5 receptor, cannabinoid receptor, A_3 adenosine receptor, PIM1 kinase inhibitor, anticancer, Aurora A kinase inhibitor and phosphodiesterase3 (PDE3) inhibitor. In recent years,triazole chemistry has evolved to a great extentdue to its important pharmacological properties.[2]In the present work, a series of novel 1,2,3-triazole linked pyridines have been synthesized *via* multicomponent reaction approach will be presented. All the newly synthesized compounds were evaluated for their *in vitro* antifungal activity and showed good to excellent activity with lower MIC value.
